ADVANCED NEURO-IMAGING INSTITUTE - MRI REPORT

Patient Name: Robert Chen (SYNTHETIC RECORD FOR TESTING)
Date of Birth: 1962-11-03 | Sex: Male | Exam Date: 2026-10-08
Radiologist: Dr. Elena Rostova, MD | Clinical Indication: Recurrent Cephalea
---
EXAMINATION: Magnetic Resonance Imaging (MRI) of the Brain without IV Contrast
TECHNIQUE: Multiplanar T1, T2, FLAIR, DWI, and Gradient Echo sequences.

FINDINGS:
- Brain parenchyma demonstrates normal morphology and signal intensity.
- Minimal punctate non-specific white matter hyperintensities in subcortical regions, common and consistent with mild chronic microvascular ischemic changes of age.
- No acute intracranial hemorrhage, mass effect, midline shift, or herniation.
- Ventricular system and basilar cisterns are within normal limits for patient age.
- Diffusion weighted imaging (DWI) reveals no evidence of acute territorial infarction.
- Major intracranial vascular flow voids appear preserved.

IMPRESSION:
1. Unremarkable brain MRI with no acute intracranial abnormality.
2. Mild chronic microvascular white matter changes, non-urgent.
3. Recommend neurologist follow-up for tension vs migraine headache management.
